The methods and compositions of the present invention are useful for diagnosing and/or treating asthma and allergy especially in a hypo-responsive subject. The present sequence represents an immunostimulatory nucleic acid of the invention.
                                                                                                                                                                                                                                                                                                                                                   Treating and/or preventing allergy or asthma using an immunostimulatory nucleic acid alone or in combination with an asthma/allergy medicament.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a method of treating or preventing allergy or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         systemic lupus erythematosus (SLE), sepsis, or cancer. The coligonucleotides are safe to use since they do not initiate an immune reaction when administered to a subject in vivo. ACAG2324-ACAG2352 represent the immunomodulatory oligonucleotides of the invention. Note: The present sequence given as SEQ ID No:1 in the Sequence listing differs from that given on page 6 (ACAG2351) and page 17 (ACAG2352) of the
                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel immunostimulatory oligonucleotide comprising 2-100 nucleotides and containing at least one unmethylated CpG dinucleotide, useful for activating a subject's B cells or natural killer cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to immunostimulatory oligonucleotides containing at least one unmethylated CpG dinucleotide, and immunoinhibitory oligonucleotides which are capable of interfering with the activity of viral or cellular transcription factors. The immunostimulatory oligonucleotides are useful for activating a subject's lymphocytes (B cells or natural Killer (NK) cells). They are useful for treating, preventing or ameliorating an immune system deficiency. The immunoinhibitory oligonucleotides are useful for treating or preventing viral infection in a subject. They are also useful for treating or your immunoinhibitory oligonucleotides are also useful for treating or immune over immune of the composition which may be used for vaccinating a subject. The composition which may be used for treating an immune disease such as

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   B-cell stimulation; CpG island; ss; viral transcription factor; cellular transcription factor; immunoinhibitor; immune system deficiency; systemic lupus erythematosus; sepsis; tumour; cancer; viral infection; fungal infection; bacterial infection; parasitic infection; vaccine;
                                                                                                                                                                                     The present invention provides oligonucleotides comprising unmethylated CpG dinucleotides. The invention is useful to activate lymphocytes specifically to activate B cells and natural killer cells, for treating diseases associated with an immune system activation such as systemic lupus erythematosus, sepsis and viral infections. The invention is useful
                                                                                                                                                                                                                                                     agent. The
                                                                                                                                                                                                                                         as an immunosuppressive, immunostimulating, immunomodulating, antibacterial, antiinflammatory, dermatological and virucidal agent. The present sequence is a mitogenic oligonucleotide used in the stimulation of B-cells. This sequence is used in the invention.
                                                                                                                        New immunomodulatory oligonucleotides containing at least one unmethylated CpG dinucleotide, useful for treating diseases including systemic lupus erythematosus and sepsis.
                                                                                                                                                                                                                                                                                                                                         Gaps

The invention relates to oligonuclectides containing at least one unmethylated CpG dinuclectide. The invention relates to an oligonuclectide delivery complex comprising an oligonuclectide of the invention and a targeting means, a method of activating a subject's B cells or natural killer cells by contacting the cells with an immune system deficiency in a subject, waccinating a subject by administering the composition in conjunction with a vaccine, a method of treating a disease associated with an immune system activation in a tubject by administering a neutral oligonuclectide alone or in conjunction with a pharmaceutical carrier, and a method of performing antisense therapy comprising methylating CpG containing oligonuclectides are useful for treating diseases associated with immune system activation, such as systemic lupus erythematosus and sepsis. Compositions comprising systemic lupus erythematosus and sepsis. Compositions comprising colligonuclectides of the invention are useful for activating a subject's B cells or natural killer cells, for treating a subject in a minimume system deficiency or for vaccinating a subject. immunoinhibitory oligonucleotides are useful for treating or preventing a viral infection in a subject. The oligonucleotides may also be used in conjunction with a vaccine to boost a subject's immune system to effect a better response from the vaccine, or for increasing the responsiveness of This sequence represents an cells to subsequent chemotherapy. unmethylated CpG dinucleotide of malignant

This invention describes novel oligonucleotides capable of interfering with the activity of viral or cellular transcription factors and containing a consensus immunoinhibitory CpG mocif having the formula: 5'GCGMGCG3', where X is a nucleotide and n is 0-50 and a phosphorothicate backbone modification. The invention also describes an oligonucleotide delivery complex comprising the oligonucleotide and a targeting means e.g. a pharmaceutical carrier. The oligonucleotide and cargeting means e.g. a pharmaceutical carrier. The oligonucleotide and subject; a preventing or amellorating an immune system deficiency in a subject; vaccinating a subject; treating a disease associated with an immune system activation in a subject (systemic lupus erythematosus or sepsis); performing antisense therapy comprising methylating CpG containing oligonucleotides prior to subject; an invivo diagnoses using oligonucleotide probes companishing methylating CpG containing oligonucleotides prior to aministration to a subject; and treating or preventing a viral infection in a subject. The targeting means is selected from cholesterol, virosome, liposome, lipid, or a target cell specific binding agent. The oligonucleotides described in the invention have antinfilammatory, New oligonucleotide comprises at least one unmethylated CpG dinucleotide, useful for stimulating an immune response or for treating diseases associated with immune system activation, e.g. systemic lupus cellular transcription factor; immunoinhibitory; CpG; phosphorothioate backbone; B cell activation; matural killer cell activation; immune system deficiency; systemic lupus erythematcous; sepsis; antisense; methylation; antiinflammatory; dermatological; immunosuppressive; virucide; ss; /note= "phosphorothioate linkage" /note= "phosphorothioate linkage" B-cell stimulating oligonucleotide ODN 1585. and containing at least one unmethylated CpG dinucleotide. The oligonucleotide is capable of interfering with the activity of viral or cellular transcription factors and containing a consensus immunoinhibitory CpG motif having the formula: 5'GGGXnGGG3', where X is a nucleotide and n is 0-50. Also included are an oligonucleotide delivery complex (comprising the oligonucleotide above and a targeting means), a complex (comprising the oligonucleotide above and a targeting means), a complex (comprising the oligonucleotide above and a targeting means), a complex (comprising the oligonucleotide above and a subject's natural killer cells, treating (preventing or ameliorating) and subject's natural killer cells, treating (preventing or ameliorating) and isease associated with an immune system activation in a subject, treating a clisease associated with an immune system methylating CpG containing oligonucleotides prior to administration to a subject), in vivo diagnoses using oligonucleotides prior to administration to a subject in vivo diagnoses oligonucleotides prior to administration to a subject and treating or preventing a viral infection in a subject. The oligonucleotide is useful for treating diseases associated with immune system activation including systemic lupus erythematosus or sepsis, or for treating, preventing, or systemic lupus erythematosus or sepsis, or for treating or preventing, or oligonucleotide is also useful for treating or preventing viral coligonucleotide is also useful deficiency in a subject. The invention. It is also useful de the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              systemic lupus erythematosus; sepsis; tumour; cancer; viral infection; bacterial infection; fungal infection; cytostatic; virucidal; antibacterial; fungicidal; antiinflammatory; dermatological; immunosuppressive; vaccine; gene therapy; phosphorothicate backbone; ss.

New oligonucleotide comprises at least one unmethylated CpG dinucleotide,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention provides novel oligonucleotides containing unmethylated CpG dinucleotides and therapeutic utilities based on their ability to stimulate an immune response in a subject. Oligonucleotides of the invention are useful for treating, preventing or ameliorating an immune system deficiency or a tumour, cancer, viral, bacterial or fungal infection. They are useful for treating diseases associated with immune system activation including systemic lupus erythematosus or sepsis. They are also useful as vaccines to boost subject's immune system. The invention is also useful in gene therapy. The present sequence is a CpG oligonucleotide used to stimulate B-cells. Note: This sequence is a CpG to be the same as that shown as SEQ ID NO: I in page 18 of the specification. However these sequences differ.
                                                                                                                                                                                                                                                                                                                                                               useful for treating, preventing, or ameliorating an immune system deficiency or a tumor, cancer, viral, bacterial, or fungal infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    CpG dinucleotide, gene therapy a; vaccine; cancer; viral infection; fungal infection; bacterial infection; parasitic infection; systemic lupus erythematosus; sepsis; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                           The present invention provides oligonucleotides comprising is useful immunomodulatory unmethylated CpG dinucleotide. The invention is useful for treating, preventing and ameliorating immune system deficiencies such as systemic lupus erythematosus and sepsis, tumour, cancer, viral, bacterial and fungal infections. The invention acts as an cytostatic, virucidal, antibacterial, fungicidal, antiniflammatory, dermatological and immunosuppressive agent. The invention is also useful in the production of vaccines and in gene therapy. The present sequence is a mitoganic cpG oligonucleotide used in B-cell activation. Note: This sequence is stated to be SEQ ID NO: 1 in the sequence listing. However, this sequence differs from the sequence designated as SEQ ID NO: 1 in the
                                                                                                                                                                                                                                               New oligonucleotide comprises at least one unmethylated CpG dinucleotide, useful for treating, preventing, or ameliorating an immune system deficiency or a tumor, cancer, viral, bacterial, or fungal infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Immune response; immune system deficiency; tumour; cancer;

Suppressing allergies, including asthma, rhinitis, urticaria and atopic dermatitis, in a subject, comprises administering a first and second dose
                                                                                                                                                                                                                                                       The invention relates to immunomodulatory oligonucleotides containing an unmethylated CpG dinucleotide. The oligonucleotide of the invention is useful in preparing a composition for treating a disease associated with an immunome system activation, e.g. systemic lupus erythematosus, sepsis or viral infection. It is also useful to prepare vaccine. The present sequence is an immunomodulatory oligonucleotide used to stimulate B
                                                                                                                                                      New oligonucleotide comprising 2-100 nucleotides and containing an unmethylated CpG dinucleotide, useful in preparing a composition for treating a disease, e.g., systemic lupus erythematosus, sepsis or viral

                                                                                                                                                                                                                                                                        The present invention relates to an oligonucleotide containing at least one unmethylated CpG dinucleotide. The invention is useful in gene therapy and for preparing vaccine. The invention is also useful for preventing, treating or ameliorating diseases associated with immune system deficiency or activation such as cancer, viral, fungal, bacterial or parasitic infection, systemic lupus erythematosus or sepsis. The present sequence is a CpG immunomodulatory oligonucleotide used in B cell

                                       The invention relates to a method of suppressing a symptom of an allergic response in a subject by administering a first and second dose of an immunostimulatory nucleic acid that comprises a nucleotide sequence comprising 5'-cg-3', and where the second dose is administered from 1 day to 8 weeks after the first dose. The methods and compositions of the present invention are useful for the treatment or prevention of asthma and allergy, including rhinitis, uritaria and atopic dermatitis, using an immunostimulatory nucleic acid alone or in combination with other medicaments. They can also be used in preventing bacterial and viral infections. This sequence represents an oligonucleotide used in the

                                                                                                                                                                                                                                                                                                                                                 The present invention relates to immunomodulatory oligonucleotides containing unmethylated CpG dinucleotides and therapeutic utilities based on their ability to stimulate an immune response in a subject. The invention is useful for treating, preventing or ameliorating immune system deficiencies such as tumor, cancer, systemic lupus erythematosus and sepsis, infections such as viral (e.g. HIV, herpes), fungal (e.g. candida sp.) and bacterial or parasitic (e.g. Leishmania, Toxoplasma) and autoimmune diseases such as rheumatoid arthritis and multiple sclerosis. The invention is also useful in antisense therapy, as in vivo hybridization probes and as antiviral therapeutics. The present sequence is a mitogenic CpG oligonucleotide used in B-cell stimulation.
                                                                                                                      Use of an immunostimulatory oligonucleotide for boosting an immune response of a subject, or for stimulating an immune response in a subject, where increases in IFN-gamma and IL-12 expression are indicators of the immune response.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ð
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  셤
                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a novel pharmaceutical composition (A) for oral administration comprising an immunostimulatory nucleic acid (1) (8-100 concloses in length) in a pharmaceutically acceptable carrier. The immunostimulatory nucleic acid is of the formula 5.X 1 X 2 CGX 3 X 4 3. (Where C and G are unmethylated). The carrier comprises an emulsion. A composition of the invention has immunomodulator, cytostatic, virucide, fungicide, antibacterial, antiparasitic, antihlammatory, dermatological, immunosuppressive, antiarthritic, antihlammatic, neuroprotective, and immunostimulant activity. A nucleic acid of the circumors, cancers or viral, fungal, bacterial or parasitic infections) or a disease (e.g. systemic lupus erythematosus, sepsis, cheumatodia erthritis and multiple sclarosis) associated with immune system activation. The nucleic acids are useful as vaccine adjuvants to stimulate a subject's response to a vaccine, and for antisense therapies or as in vivo hybridization probes. The present sequence represents an immunosiant contains and co
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ;

                                                                                                                                                                                                                        The invention comprises a method of treating HIV by administering a CpG nucleic acid (e.g. an adjuvant-type nucleic acid or an IFN-alpha-inducing CpG nucleic acid) and an anti-HIV therapy (e.g. an inhibitor of HIV replication). The method of the invention is useful for the treatment and prevention of HIV. The present DNA sequence represents an oligonucleotide that was used to stimulate B cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Immune modulation; immunotherapy; antisense therapy; hybridization; interferon-gamma; cytokine; immune deficiency; immunostimulant; immune disorder; tumor; cancer; cytostatic; neoplasm; viral infection; virucide; infection; fungicide; bacterial infection; antibacterial; parasitic infection; antiparasitic; nucleic acid vaccine; leukemia; systemic lupus erythematosus; antiinflammatory; dermatological; immunosuppressive; sepsis; autoimmune disease; ss.

The invention relates to a method for increasing interferon (IFN)-gamma in a subject. The method involves administering an immunostimulatory oligonucleotide/delivery complex to modulate immune response of the subject. The invention is useful for treating diseases associated with immune system deficiency e.g. tumor or cancer or viral, fungal, bacterial or parasitic infections, as vaccine, for treating leukemia, systemic lupus erythematosus, sepsis and autoimmune diseases. The present sequence is the CpG oligonucleotide used to stimulate B cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New modified proteinaceous composition, useful for treating e.g., tumors.
                                           Use of immunostimulatory oligonucleotide delivery complex comprising oligonucleotide linked to biodegradable delivery complex for increasing interferon-gamma levels and treating diseases associated with immune system deficiency e.g. cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Ricin; (x) Asp(y); primer; mutant; mutagenesis; ss; vascular leak syndrome; VLS; cancer; immunotoxin; IT; cytokine; RTA; aphasia; myaglia; fatigue; hypotension; rhabdomyolysis; MAb; ribosome inactivating protein; RTP; vaccine; graft vs. host disease; GVHD; non-Hodgkin's lymphoma; Hodgkin's lymphoma; cyrostatic; immunosuppressive; myloma; tumour; monoclonal antibody.

coid mutation that alters the ability of a (x)Asp(y) sequence to induce Vascular Leak Syndrome (VLS). The present invention relates to the field of physiology and cancer biology. The invention provides immunotoxins (TTS) and cytokines, methods for producing them, which have been mutated to lack amino acid sequences which induce VLS or other side effects. Also claimed is a ricin A chain toxin (RTA) with a reduced ability to promote toxicity in a patient, where at least one amino acid flanking the toxicity in a patient, where at least one amino acid flanking the coricity in a patient is further defined as VLS, aphasia, myalgia, fatigue, hypotension or rhabdomyolysis. Its are hybrid molecules consisting of monoclomal antibodies (MABs), or other cell binding ligands, which are biochemically or genetically linked to toxins, toxin subunits or ribosome inactivating proteins (RIPs) from plants, fungi or bacteria. The modified proteinaceous composition is plants, fungi (e.g. vaccine) graft vs. host disease (GVHD), non-Hodgkin's and Hodgkin's lymphoma, myloma and some solid tumours. The sequence presented is a primer which was used to mutate the RTA (x)Asp(y)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Bacillus stearothermophilus template-dependent DNA polymerase for preparing cDNA molecule from RNA template comprises reverse transcriptase activity in the presence of magnesium ions and absence of manganese ions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      PCR primer; DNA polymerase; reverse transcriptase; rabbit; tissue factor;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to a purified thermostable template-dependent DNA polymerase from Bacillus stearchtermophilus comprising reverse transcriptase (RT) activity in the presence of magnesium ions at a concentration of 1 mM and in the substantial absence of manganese ions. The DNA polymerase is useful for preparing cDNA molecules from RNA polymerase and for amplifying a nucleic acid. The present sequence is a PCR primer for rabbit tissue factor (RTF). This sequence was used to demonstrate the activity of the DNA polymerase of the present invention
a protein having a (x) Asp(y) sequence and at least one amino
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               concoding enzymes associated with drug metabolism. The invention relates encoding enzymes associated with drug metabolism. The invention relates concoding enzymes associated with drug metabolism. The invention relates to methods and compositions for identifying individuals who have at least one polymorphism may be identified in a nucleic acid sample using probes or primers specific for a sequence selected from ABZ4317-ABZ50807 using a variety of detection assays, including hybridisation assays, nucleic acid errays and PCR-based methods. The invention also encompasses methods of evaluating and screening drugs using genetic polymorphisms (SNPs), may be used in studying the relationship between DNA sequence variations and human diseases, conditions, and responses to drugs. SNPs are also useful as polymorphism markers for discovering genes that cause or exacerbate certain diseases. SNPs are particularly useful in the above respects as they are stable in populations, occur frequently, and have lower mutation rates than other genome variations

c such as repeating sequences. The detection and analysis of polymorphisms in genes encoding drug metabolising enzymes allows the customisation of drug therapies based upon the genetic profile of individual patients.

This would not only take the guesswork out of selecting the drug with the care the likelihood of adverse reactions, thereby increasing safety.

CC greatest therapeutic effect for a particular patient, but would also cereduce the likelihood of adverse reactions, thereby increasing safety.

CC approval processes. For example, individuals could be selected for capable of responding to a particular drug or drug class, and previously failed drug candidates could be revived if they were matched with more capable of responding to a particular drug or drug class, and previously failed drug candidates could be revived if they were matched with more compropriate patient populations. The methods, data and compositions of the invention may therefore lead to a an increase in the range of possible drug trials, the time taken for a drug to be approved, the length of time patients are on medication and the number of different companions, failed drug trials, the time taken for a drug to be approved, the length of time patients are on medication and the number of different companions a patient needs to take before finding an effective therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Identifying individuals having a polymorphism, useful for determining the effectiveness or side effect of a drug or treatment protocol, comprises detecting at least one polymorphism in the drug metabolizing enzyme nucleic acid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; drug metabolising enzyme; gene; drug metabolism; chromosome 22; polymorphic site; drug evaluation; drug screening; genotyping; genetic profiling; therapeutic customisation; adverse reaction; clinical trial; drug approval; single nucleotide polymorphism; SNP; ds.

Sequences ABZ43217-ABZ50887 represent polymorphic sites within genes encoding enzymes associated with drug metabolism. The invention relates concoding enzymes and compositions for identifying individuals who have at least to methods and compositions for identifying enzyme-encoding genes. The polymorphisms may be identified in a nucleic acid sample using probes or primers specific for a sequence selected from ABZ4317-ABZ50887 using a variety of detection assays, including hybridisation assays, nucleic acid arrays and PCR-based methods. The invention also encompasses methods of evaluating and screening drugs using genetic polymorphism data. Genetic polymorphisms data, particularly that relating to single nucleotide polymorphisms (SNPs), may be used in studying the relationship between polymorphisms (SNPs) and be used in studying the relationship between cargorizations and human diseases, conditions, and responses to that cause or exacerbate certain diseases, SNPs are particularly useful in the above respects as they are stable in populations, occur frequently, and have lower mutation rates than other genome variations such as repeating sequences. The detection and analysis of polymorphisms (CC frequently, and have lower mutation rates than other genome variations such as repeating sequences. The detection and analysis of polymorphisms (CC drug therapies based upon the genetic profile of individual patients. This would not only take the guesswork out of selecting the drug discovery and captured for the invention are also useful in the drug discovery and approval processes. Por example, individuals could be selected for educe the likelihood of adverse reactions, thereby increasing safety. Methods of the invention are also useful in the drug discovery and captured partiant populations. The methods of daverse drug or drug candidates could be revived if they were matched with more appropriate partient populations. The methods of adverse land decreases in the number of adverse drug the partiant patient patient patient

```
primers used in methods for amplifying a nucleic acid segment. The branched modular primer comprises of front and back oligonucleotide modules. The front module (FM) and back module (BM) comprise of a stem segment having a sequence that is the same from module to module and an arm segment having a sequence that varies from module to module. The arm of the back and front modules are annealed to a template which contains the priming site. These modules are designed for priming sites in lambda phage DNA. The composition is useful for amplifying a nucleic acid segment, e.g. by polymerses chain reaction (FCR). The present sequence is prooffreading amplification primer FR2-379 used for improving sequence is Bacteriophage lambda reverse priming site 19379 specificity
                                                                                                                                                                                                                                                          New composition comprising front and back oligonucleotide modules, each module has a stem and an arm segment with varying or constant sequences, useful for amplifying nucleic acid segments such as in polymerase chain
                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to compositions for branched modular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 22 BP; 4 A; 3 C; 8 G; 5 T; 0 U; 2 Other;

Ulanovsky L, Raja MC; (UYCH-) UNIV CHICAGO.

(A) with modified metabolic partways comprising: (a) genetic modification of a microorganism to inhibit production or consumption of a metabolite when it is grown on a defined medium, thus affecting its ability to grow; (b) growing the modified organism in the defined medium so that evolution can occur, optionally with addition of a co-substrate to allow evolution; and (c) selecting as (A) cells able to grow on the medium, optionally in presence of co-substrate. The evolved microorganisms (A), or evolved proteins (I) expressed by them, are useful in biotransformation processes, especially those involving NaDPH-dependent enzymes, particularly synthesis of amino acids (Met. Cys. Thr. Lys or Ile) but also synthesis of mucleic acids or lipids, and metabolism of sugars. (A) provide more efficient production of selected metabolism of sugars. (A) strains. This sequence represents a nucleic acid molecule used in the method of the invention.

Sequence 30 BP; 7 A; 8 C; 9 G; 6 T; 0 U; 0 Other;

relates to a method for preparing evolved microorganisms

                                                                                                                                               The present invention describes a method for amplifying a template nucleic acid segment (1), comprising annealing (1) to a branched primer having front (FOW) and back oligonucleotide modules with arm segments complementary to a site in (1), extending the arm of FOM to form an extending RP to form second initial extension strand, and amplifying the extending RP to form second initial extension strand, and amplifying the second strand. The method can be used for amplifying nucleic acid segments, useful in genome mapping, biomedical research and clinical diagnostics. The method climinates the need for custom primer synthesis in methods to amplify nucleic acid segments. The modular combination of just a few oligonucleotides essentially minics the performance of a conventional, custom-made primer by matching a sequence of a priming site in the template. AMF74910 to AAF7499 represent coligonucleotide sequences used in the exemplification of the present invention. N.B. Any Ne given in the oligonucleotide sequences represent inosine bases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                   Amplifying a template nucleic acid segment, involves annealing a combination of several branched and/or covered oligonucleotide modules selected from a pre-synthesized library, to the template DNA.

be used in the treatment of cancer, such as: hepatocellular cancer, breast cancer, colon cancer, prostate cancer, lung cancer, bladder cancer, ovarian cancer, renal cancer, glioblastoma, pancreatic cancer and non-Hodgkin's lymphoma. The present nucleic acid represents a human survivin-specific siRNA sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention comprises dsRNA oligomeric sequences which are targeted to the human survivin gene. The dsRNA oligomeric compounds of the invention are useful for inhibiting expression of the human survivin gene, and can be used in the treatment of cancer, such as: hepatocellular cancer, breast cancer, cancer, prostate cancer, lung cancer, bladder cancer, renal cancer, ploblastoma, pancreatic cancer onn-Hodgkin's lymphoma. The present nucleic acid represents a human survivin-specific siRNA sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel double-stranded compound, modulating expression of human survivin, useful for treating condition associated with survivin expression or overexpression, such as breast cancer, colon cancer, lung cancer, bladder
                                                                                                                                                                                                                                                                                                                                                                                                                                                            survivin; antisense therapy; gene silencing; cancer; cytostatic; breast tumor; broast tumor; brund tumor; brostate tumor; brung tumor; brund tumor; processes tumor; non-hodgkin lymphoma; hepatocellular carcinoma; ss; siRNA; short interfering RNA;

response. The method comprises administering an immunostimulatory nucleic acid to a non-rodent subject in sufficient quantity to stimulate an immuno response. The present sequence is one such immunostimulatory nucleic acid. The immunostimulatory nucleic acids can be pyrimidine rich (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects against tumour antigens, viral antigens (e.g. herpesviridae, retroviridae and/or orthomyxoviridae), bacterial antigens (e.g. toxoplasma, haemophlus, campylobacter, clostridium, Escherichia coli and/or staphylococcus), fungal antigens and/or parasitic antigens. The method is also useful for preventing cancer, asthma, infectious disease, allergy or immune deficiency. The present sequence can also be used to redirect a Th2 to a Th1 immune response and to activate immune cells. Note: the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                            response. The method comprises administering an immunostifundatory nucleic acid to a non-rodent subject in sufficient quantity to stimulate an immunostifundatory. The response. The present sequence is one such immunostifundatory nucleic acid. The immunostifundatory nucleic acids can be pyrimidine rich (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects against tumour antigens, viral antigens (e.g. horpesviridae, retroviridae, and/or orthomyxoviridae), bacterial antigens (e.g. toxoplasma, haemophilus, campylobacter, clostridium, Escherichia coli and/or staphylococcus), fungal antigens and/or parasitic antigens. The method is staphylococcus, preventing cancer, asthma, infectious disease, alleryy or immune deficiency. The present sequence can also be used to redirect a Thi to a Thi immune response and to activate immune cells. Note: the present sequence may have a phosphorothioate backbone

administering at least one antiangiogeness; in a subject, congitishing administering at least one antiangiogenic nucleic acid molecule. Also included is a kit comprising a first container housing the antiangiogenic nucleic acids, and instructions for administering them to a subject having a condition characterised by unwanted angiogenesis. The method is useful for inhibiting angiogenesis associated with solid tumour growth, tumour metastasis, precancerous lesion, rheumatoid arthritis, psoriasis, diabetic retinopathy retinopathy of prematurity, macular degeneration, corneal graft rejection, neovascular glaucoma, retrolental fibroplasia, rubeosis, Osler-Webber Syndrome, myocardial angiogenesis, plaque neovascularisation, telangiectasia, haemophiliac joints, anglofibroma, wound granulation, intestinal adhesions, atherosclerosis, scleroderma and hypertrophic scars. The present sequence is an antiangiogenic nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ;

musculus C57BL/6J (male) was obtained from the Jackson
Laboratory Mouse DNA Resources (Jackson Laboratory Mouse)
was blunt end-repaired with T4 DNA polymerase and T4
polymucleotide kinase. Adaptor oligomucleotides were
ligated to the blunt ends in high molar excess. The
adaptored DNA was purified and size-selected for a 9.5 to
10.5 kb range using preparative agarose gel
electrophoresis. Vector DNA was prepared from a derivative
of pwD42 (gi|4732114|gb|AR129072.1), a copy-number
inducible derivative of plasmid R1. The vector was ligated
with adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Rm. 308, Biomedical Polymers Research Bldg., 20 S. 2030 E., SLC, UT 84112, USA

/clone libe-Sugano mouse kidney mkia"
/note-Torgan: kidney, Vector: pME188-FL3; Site 1: DralII
(CACTGTGTG); Site_2: DralII (CACCATGTG); 1st strand cDNA
was primed with an oligo(dT) primer
[ATGGCCTTTTTTTTTTTTTTT]; double-stranded cDNA was
ligated to a DralII adaptor [TGTTGGCCTACTGG], digested
and cloned into distinct DralII sites of the pME188-FL3
vector (5' site CACTGTGTG, 3' site CACCATGTG). XhoI should
be used to isolate the CDNA insert. Size selection was
performed to exclude fragments <1.5kb. Library
constructed by Dr. Sumio Sugano (University of Tokyo
Institute of Medical Science). Custom primers for
sequencing: 5' end primer CTTCTGCTCTAAAAGCTGCG and 3' end
primer CGACCTGCAGCACA."

```
(http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pwD42 (gilfa712114 [gpl]AR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to chemically-competent E. coll XIIO-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         GSS 01-APR-2003

site 'www.zmdb.iastate.edu' and follow the links for 'RescueMu.' Grid P was grown at Molokai in 2002. DNA was extracted from leaf strips, double digested using BamHI and BglII, and ligated to form circular plasmids. DH10B were transformed and then screened on LB plates with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.05 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Rm. 308, Biomedical Polymers Research Bldg., 20 S. 2030 E., SLC, UT 84112, USA

/note="Vector: PWD42nv; Purified genomic DNA from M.
musculus C57BL/6J (male) was obtained from the Jackson
Laboratory Mouse DNA Resources/documents/documents
/http://www.jax.org/resources/documents/documents/). The DNA
was hydrodynamically sheared by repeated passage through a
0.05 inch orifice at constant velocity. The sheared DNA
was blunt end-repaired with T4 DNA polymerase and T4
polymucleotide kinase. Adaptor oligonucleotides were
ligated to the blunt ends in high molar excess. The
adaptored DNA was purified and size-selected for a 9.5 to
electrophoresis. Vector DNA was prepared from a derivative of pwD42 (gi|4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli Xil0-Gold (Stratagene) cells and selected for ampicillin resistance."

     10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gi|4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent B. coli X110-Gold (Stratagene) cells and selected for ampicillin resistance."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Inductible C7/Def Name of Markey was Colorined from the Dackson Laboratory Mouse DNR Resource (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pwD42 (gi|4732114|gb|AR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.05 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel

Unpublished (1998)
electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gi|4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into adaptored to the competent E. coli XLIO-Gold (Stratagene) cells and selected for ampicillin resistance."

/note="Vector: pBluescriptSK-; Site_l: EcoRI; Site_2:
Xhol; Unidirectional cloning. EcoRI side has T3 primer and
predominantly 5' reads. T7 primer on Xhol side of insert.
Nitrogen starvation library. Cells were inoculated into
minimal medium and grown for two days with shaking (150
rpm) at room temperature. Culture was harvested, blended,
inoculated into minimal medium as above for 24 h Cells
were harvested, washed with water and inoculated into
minimal medium base lacking nitrogen source for 6 h.
Sequences were processed by one of two methods. Where a
full-length alignment to the M. grisea genome sequence was
available, the EST sequence was trimed according to the
alignment, otherwise sequence quality was assessed using
phredPhrap version 991019 and trimmed according to phd
files (0.05) and for vector seqs."

The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared but was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pwd92 (gi|4732114|gb|RF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to

/note="Organ: oclon" Vector: pT7T3D-Pac (Pharmacia) with a modified polylinker; lst strand cDNA was prepared from colon adenocarcinoma, and was then primed with a Not I - oligo(dT) primer. Double-stranded cDNA was ligated to Eco RI adaptors (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of the modified pT7T3
vector. Library is normalized. Library was constructed by Bento Soares and M. Fatima Bonaldo. "

(http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gal electrophoresis. Vector DNA was prepared from a derivative of pWAPA2 (gil #1732114 [gb] API29072.1), a copy number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent B. coli X110-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Hominidae; Homo.

/lab host="DH108"
/clone_lib="NCI_CGAP_GC4"
/note="Vectors: pT7130-Pac (Pharmacia) with a modified
polylinker; lst strand cDNA was prepared from 3 pooled
germ cell tumors, and was then primed with a Not I -
oligo (4T) primer: Double-stranded cDNA was ligated to Eco
RI adaptors (Pharmacia), digested with Not I and cloned
into the Not I and Eco RI sites of the modified pT773
vector. Library is normalized. Library was constructed by
Bento Soares and M. Patima Bonaldo. "
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 BE615718 49 bp mRNA linear EST 24-AUG-2000 601279832F1 NIH_MGC_39 Homo sapiens cDNA clone IMAGE:3622110 5', mRNA sequence.

/clone lib="Mouse 10kb plasmid UUGCIM library"
/note="Wector: PWD42ry; Purified genomic DNA from M.
musculus C57BL/6J (male) was obtained from the Jackson
Laboratory Mouse DNA Resource
(http://www.jax.org/resources/documents/dnares/). The DNA
was hydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was hydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was blunt end-repaired with T4 DNA polymerase and T4
polymucleotide kinase. Adaptor oligomucleotides were
ligated to the blunt ends in high molar excess. The
adaptored DNA was purified and size-selected for a 9.5 to
10.5 kb range using preparative agarcse gel
electrophoresis. Vector DNA was prepared from a derivative
of pWDA2 (gil 4732114) glo | AR129072.1); a copy-number
inducible derivative of plasmid R1. The vector was ligated
with adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
adaptored vector DNA, and transformed into
chemically-competent E. coli XLIO-Gold (Stratagene) cells
and selected for ampicillin resistance."
